RECRUITMENT PROCESS IMPROVEMENT

A Business Analysis Case Study

Analysing Recruitment Inefficiencies and Designing an Improved Hiring Process

Prepared by: Palak Jain

Project Type: Business Analysis & Process Improvement

Business: Zen Yoga Studio

Domain: Human Resources — Recruitment

Project Status: Process Analysis and Proposed Solution Designed

Date: October 2026

Business Overview

Zen Yoga Studio is a startup wellness business based in Gurugram, offering both online and offline yoga classes, meditation sessions, and wellness programs for people of different age groups and fitness levels.

The studio aims to promote healthier lifestyles by providing accessible yoga and wellness services in a welcoming environment. Its target customers include students, working professionals, homemakers, senior citizens, and fitness enthusiasts.

As the business is currently in the market research and branding phase, establishing effective internal processes is important to support its future operations.

This case study focuses on improving the recruitment and selection process for yoga instructors.

Problem Statement

Business Problem

In the proposed recruitment procedure for Zen Yoga Studio, a single HR representative is responsible for managing a high volume of job applications and handling multiple recruitment activities. This may lead to hiring delays, repetitive manual work, inconsistent candidate screening, and difficulty tracking applications.

Project Objective

The objective is to design an improved recruitment process that reduces hiring delays, standardizes candidate screening, minimizes manual work, and improves candidate tracking.

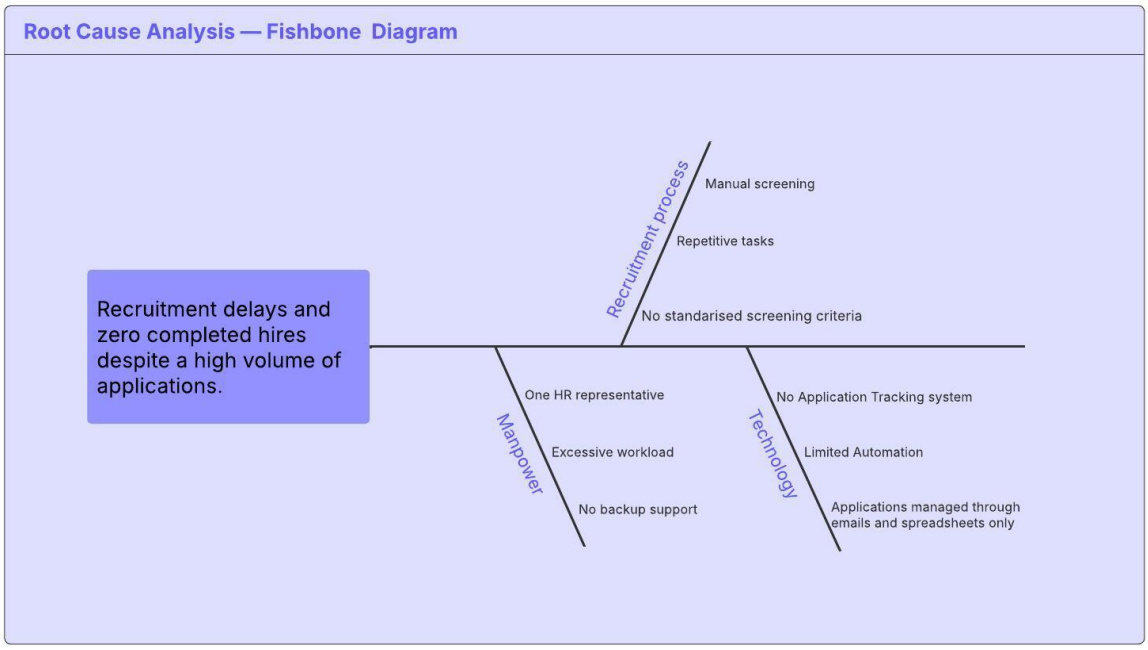

Root Cause Analysis

Root cause analysis was conducted to identify the underlying reasons for potential inefficiencies in Zen Yoga Studio's recruitment process.

Two techniques were used:

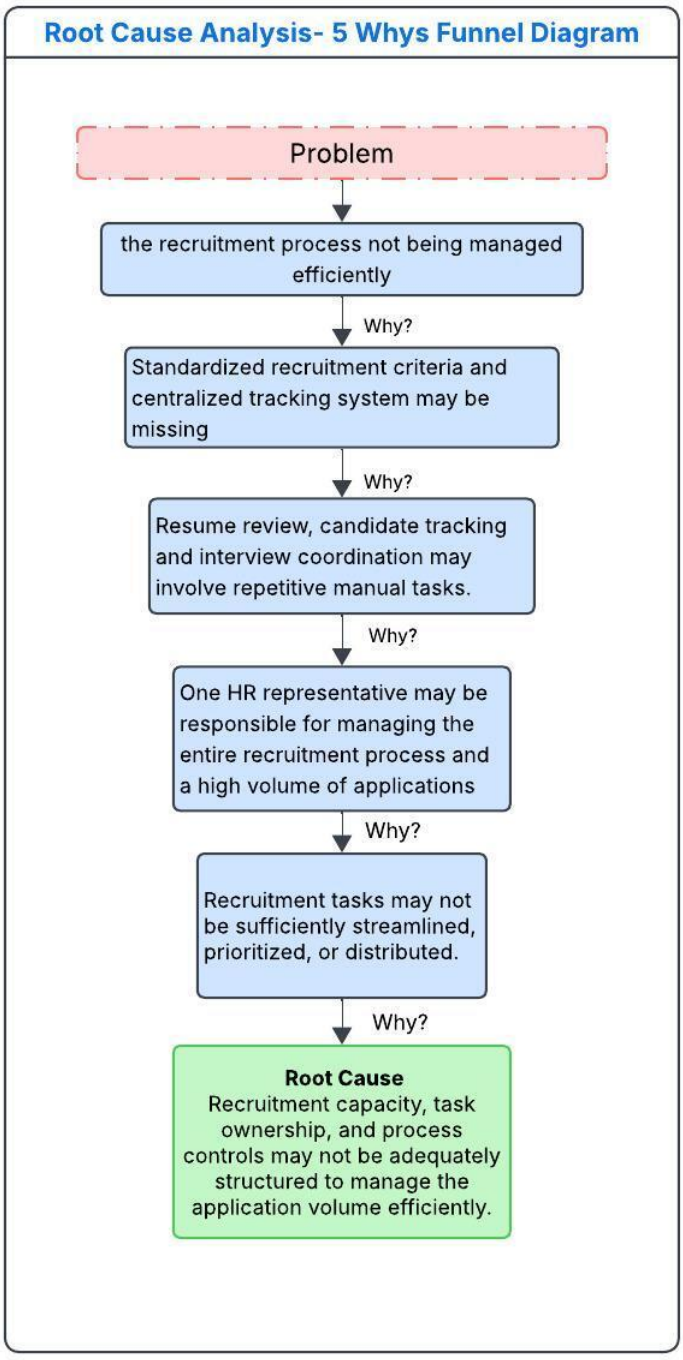

Fishbone Diagram (Cause-and-Effect Analysis)

This diagram categorizes the possible causes contributing to recruitment delays and process inefficiencies.

5 Whys Analysis

This technique explores the problem by repeatedly asking “Why?” to identify its underlying root cause.

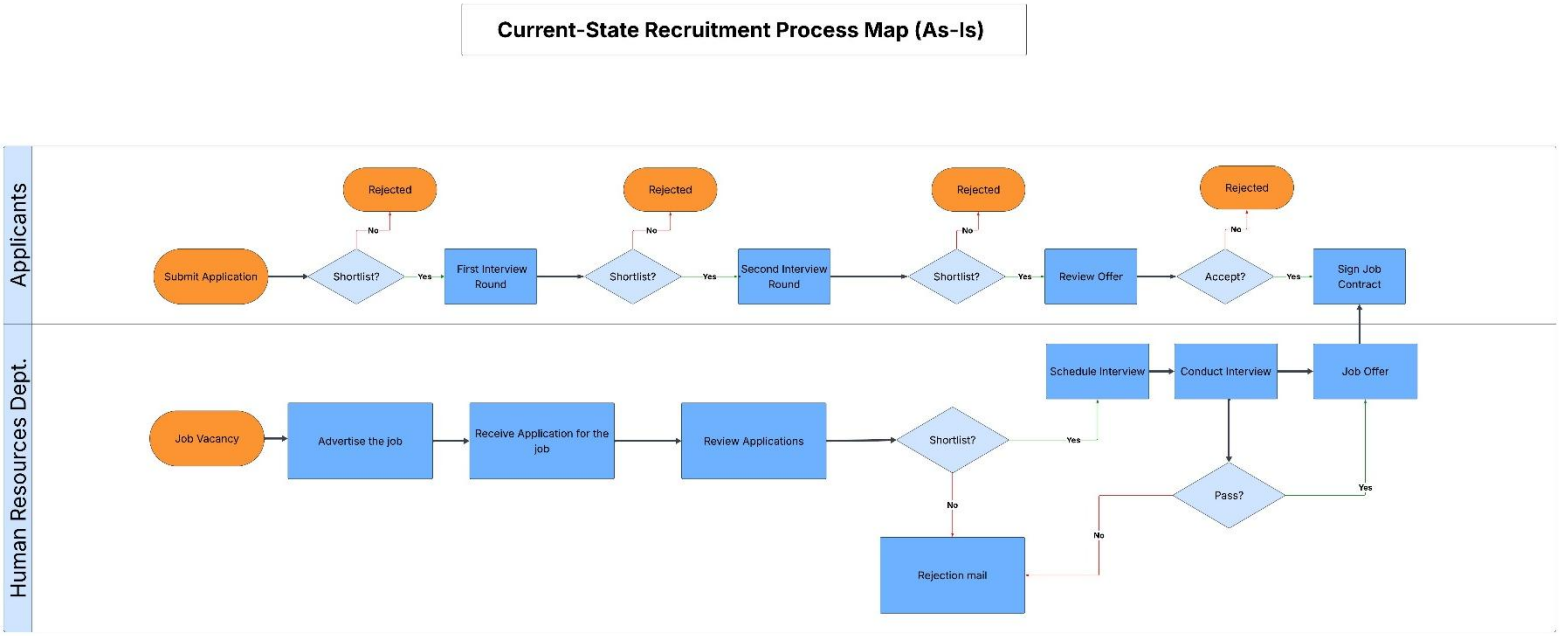

As-Is Recruitment Process

The As-Is process represents the existing recruitment process in the hypothetical scenario at Zen Yoga Studio.

The recruitment process is managed by a single HR representative who handles multiple recruitment activities. Without standardized screening criteria and a centralized candidate tracking system, managing applications and coordinating recruitment stages

The existing process map illustrates the sequence of activities, identifies potential bottlenecks, and provides a basis for designing an improved recruitment workflow.

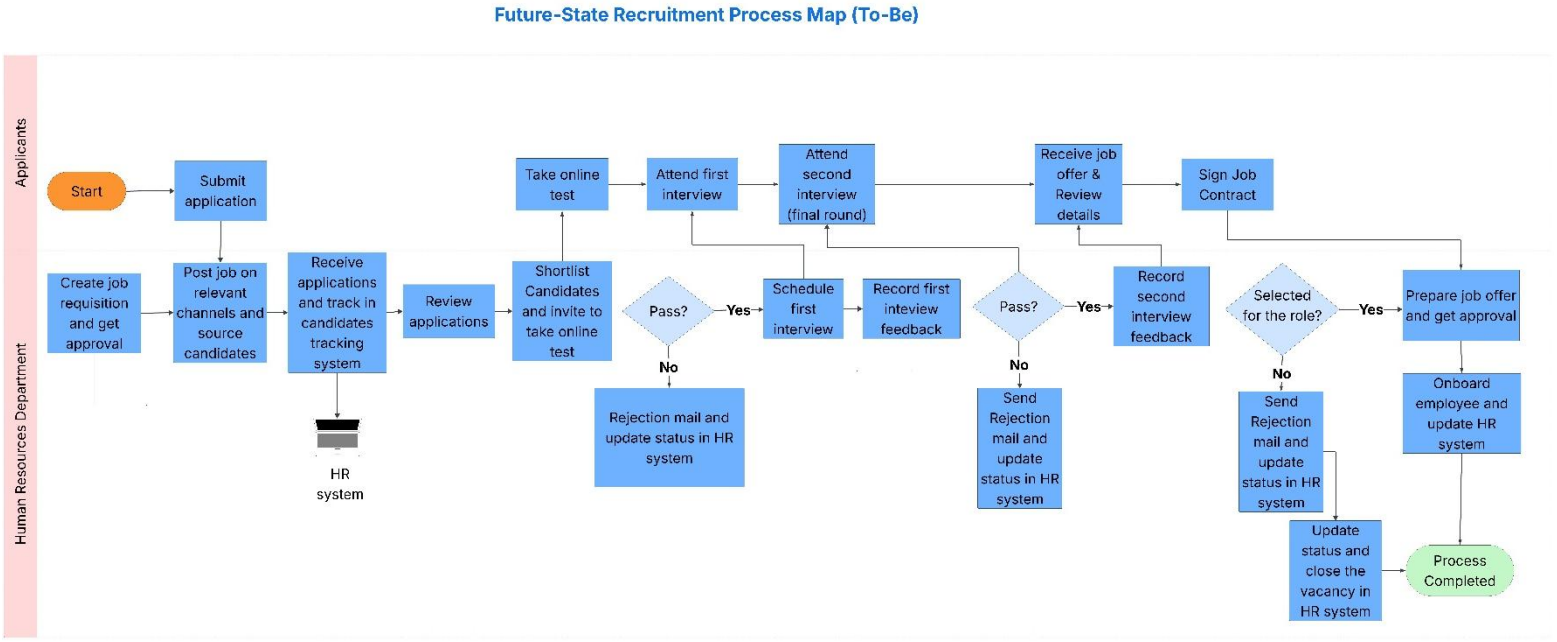

To-Be Recruitment Process

The To-Be process represents an improved recruitment process to address the potential inefficiencies identified in the As-Is process.

The improved process introduces a centralized candidate tracking system to maintain application records and improve recruitment progress monitoring. Standardized screening criteria and an online test help make the initial evaluation more consistent.

Candidates who pass the screening stage proceed to the first interview, followed by a second and final interview. Candidates selected at the final stage receive a job contract.

These improvements aim to reduce repetitive manual work, improve application tracking, standardize candidate evaluation, and make the overall recruitment process more efficient.

Conclusion

This case study demonstrates how Business Analysis techniques can be used to identify recruitment process inefficiencies and design practical improvements.

Through root cause analysis and As-Is and To-Be process mapping, an improved recruitment process was proposed for Zen Yoga Studio. The proposed solution includes standardized screening criteria, an online test, two interview rounds, and a centralized candidate tracking system.

These changes are expected to improve application tracking, reduce repetitive manual work, support consistent candidate evaluation, and reduce recruitment delays.

As Zen Yoga Studio is still in the planning phase, these benefits are expected outcomes and would need to be evaluated after implementation using appropriate performance metrics.
